

Documentation

Open Eclipse, and navigate to file in the upper left corner. Select import from the lower portion of the menu which will prompt for project location selection. Choose 'Existing Projects into Workspace' from the 'General' directory, and press next button.

In next window click the browse button, next to the select root directory option, and select source directory. The project will appear in the projects list below, then click select all button and click finish to import project. The imported project will appear in the navigator pane on the left, double click the folder to open the project and click the arrow to expand the compiler folder, and src directory within compiler. Double click compilerGUI.java to open up main source file, now navigate to the Project menu located at the top and click build all.

The project is successfully built, and the green play button or by using the run menu and clicking Run can be used to run the project.

Compile – OwensMilestone2.java

Run – TxtEdGUI.java
